Susceptibility trends in pneumonia pathogens and current prescribing.

Paul M. Tulkens, MD, PhD

Cellular and Molecular Pharmacology & Center for Clinical Pharmacy

Louvain Drug Research Institute,

Université catholique de Louvain

Brussels, Belgium

24th ECCMID Barcelona, Spain 10 – 13 May 2014

ESCMID EUROPEAN SOCIETY OF CLINICAL MICROBIOLOGY AND INFECTIOUS DISEASES

Session: Optimising diagnosis and appropriate antibiotic prescribing in pneumonia

With approval of the Belgian Common Ethical Healthplatform – visa no. V1/14/04/30/060865

Disclosures

Financial support from

- the Belgian *Fonds de la Recherche Scientifique* for basic research on pharmacology antibiotics and related topics
- *Université catholique de Louvain* for past personal support
- Commercial Relationships:
  - AstraZeneca, GSK, Sanofi-Aventis, Bayer HealthCare, Cempra Pharmaceuticals, The Medicines Company, Northern Antibiotics, RibX, Cubist, Galapagos, …
- Other relationships in relation to this talk
  - Belgian Antibiotic Policy Coordination Committee,
  - European Medicines Agency (as expert for the agency and for Industry)

Do we have a problem ?

Obituary

J.-M. Ghuysen

This man discovered the mode of action of penicillin

Ann. Rev. Biochem. 1979. 48:73–101

USE OF MODEL ENZYMES IN THE DETERMINATION OF THE MODE OF ACTION OF PENICILLINS AND Δ^3-CEPHALOSPORINS[1]

Jean-Marie Ghuysen, Jean-Marie Frère, Mélina Leyh-Bouille, Jacques Coyette, Jean Dusart, and Martine Nguyen-Distèche

Service de Microbiologie, Faculté de Médecine, Institut de Botanique, Université de Liège, 4000 Sart Tilman, Liège, Belgium

and died from invasive pneumococcal infection …

http://www.cip.ulg.ac.be/newsite/pdf/jmghuysen.pdf

Which problem ?

- **Community-acquired pneumonia (CAP):**
  - remains a major acute cause of death (6th in patients > 65 y);
  - *Streptococcus pneumoniae* is the most commonly identified pathogen, but other bacteria may be critical in specific environments (the causative organisms remains, however, unidentified in 30% to 50% of cases)
  - Resistance to "older" antibiotics is growing …
- **Hospital/Health Care-acquired/Ventilator associated pneumonia (HCAP/HAP/VAP)**
  - 2nd most frequent acquired infection in the hospital
  - carries a still higher mortality burden (13-55 %)
  - can be caused by a larger variety of organisms highly influenced by prior exposure to antibiotics, type of patient and comorbidities
  - Enteric Gram (-), *S. aureus*, and *P. aeruginosa* are predominant with resistance increasing if late onset (hospital strains)

Infectious Diseases (Cohen, Opal & Powderly, eds), 3d edition, Elsevier 2010,
- Niederman M.: Community-acquired pneumonia (chapter 27)
- Papazian L & Donati SY: Hospital-acquired pneumonia (chapter 28)

available on line at http://www.expertconsultbook.com (last access: 18-03-2014)

BUT…

- **Community-acquired pneumonia (CAP):**
  - remains a major acute cause of death (6th in patients > 65 y);
  - *Streptococcus pneumoniae* is the most commonly identified pathogen, but other bacteria and the atypical pathogens (the causative [illegible] diseases)
  - Resistance to "older" antibiotics is growing …
- **Hospital/Health Care-acquired/Ventilator associated pneumonia (HCAP/HAP/VAP):**
  - 2d most frequent acquired infection in the hospital
  - carries a still higher mortality burden (13-55 %)
  - can be caused by a larger variety of organisms highly influenced by prior exposure to antibiotics, type of patient and comorbidities
  - Enteric Gram (-), *S. aureus*, and *P. aeruginosa* are predominant with resistance increasing if late onset (hospital strains)

Those categorical differences are now blurring…

Woodhead M. *Thorax*. 2013;68:985-6.
Quartin AA, *et al. BMC Infectious Diseases.* 2013,13:561

A quick survey of the main (common) bacterial causative organisms

CAP and HCAP	
Outpatient, no sigificant comorbidity	***Streptococcus pneumoniae*** ***Mycoplasma pneumoniae***, *Chlamydophila pneumoniae,* ***Haemophilus influenzae***, *Legionella* spp., *Mycobacterium tuberculosis*, endemic fungi)
Outpatient, comorbities or HCAP with no resistance risk factors	**Drug resistant *Streptococcus pneumoniae* (DRSP)** Enteric Gram-negative; anaerobes (with aspiration)
Inpatient, with comobidities or HCAP with no resistance risk factors	***Streptococcus pneumoniae* (including DRSP)**, ***Haemophilus influenzae***, ***Mycoplasma pneumoniae***, *C. pneumoniae*, *Legionella* spp. Enteric Gram-negatives, anaerobes, others…
Severe CAP, with no risks for *Pseudomonas aeruginosa*	***Streptococcus pneumoniae* (including DRSP)**, ***Haemophilus influenzae***, ***Mycoplasma pneumoniae,*** Legionella spp., ***Staphylococcus aureus*** Gram-negative bacilli, others
Severe CAP, with risks for *P. aeruginosa*, or HCAP with resistance risk factors	All of the above pathogens, plus ***P. aeruginosa***

Infectious Diseases (Cohen, Opal & Powderly, eds), 3d edition, Elsevier 2010,
• Niederman M.: Community-acquired pneumonia (chapter 27))
available on line at http://www.expertconsultbook.com)

A quick survey of the main (common) bacterial causative organisms

HAP	
Early pneumonia	***Streptococcus pneumoniae*** ***Haemophilus influenzae***, **Methicillin-sensitive *Staphylococcus aureus* (MSSA)** Escherichia coli and non-resistant EGNB,
Late pneumonia	***Pseudomonas aeruginosa*** *Acinetobacter* spp., **Antibiotic-resistant *Enterobacteriaceae***, **Methicillin-resistant *Staphylococcus aureus* (MRSA)**
Other situations	Coagulase-negative *staphylococci*
	Neisseria spp., *Moraxella* spp. *Enterobacter* spp., *Proteus* spp. *Burkholderia cepacia* *Acinetobacter* spp. *Stenotrophomonas maltophilia*
	Anaerobes (*Peptostreptococcus*, Veillonelia, *Bacteroides* spp. *Fusobacterium* spp., *Prevotella* spp., *Actinomyces* spp.
	Intracellular (*Legionella* spp. *Chlamydia pneumoniae*, *Mycoplasma pneumoniae*)

Infectious Diseases (Cohen, Opal & Powderly, eds), 3d edition, Elsevier 2010,
• Papazian L & Donati SY: Hospital-acquired pneumonia (chapter 28)
available on line at http://www.expertconsultbook.com (last access: 18-03-2014)

What is my goal ?

- Discuss with you the trends of resistance of some of these organisms
- how it may impact on you prescription habits…
- leaving to the next speakers the discussion of guidelines …

4 Department of Internal Medicine-Infectious Diseases, Katholieke Universiteit Leuven, University Hospital Gasthuisberg, Leuven, Belgium

Van Bambeke F, *et al. Drugs.* 2007;67:2355-82.

Streptococcus pneumoniae: main mechanisms of resistance

Antibiotic class	Mechanism	Genetic support	Drugs affected	Consequence
β-lactams	↘ Affinity of PNP1a, PBP2x and PBP2b	mosaic genes	all (variable extent)	↘ susceptibility
Macrolides	Methylation of 23S rRNA	*erm(B)*	all except ketolides unless multiple mutations	full resistance
	active efflux	*mef(A)*	14- and 15-membered ring	moderate (?) resistance
Fluoroquinolones	↘ affinity to DNA-gyrase/topisomer-ase complex	point mutations	all (variable extent)	full resistance if several mutations
	active efflux	(*pmrA*) *patA-patB*	gatifloxacin, gemifloxacin [1]	↘ susceptibility
Tetracyclines	ribosomal protection	*tet(A)*, *tet(O)*	all except glycylcyclines	Full resistance
Sulfonamides	↘ of inhibition of dyhydropteroate synthase	repetition of codons for aminoacids	all	Full resistance

[1] also norfloxacin and ciprofloxacin (not recommended)

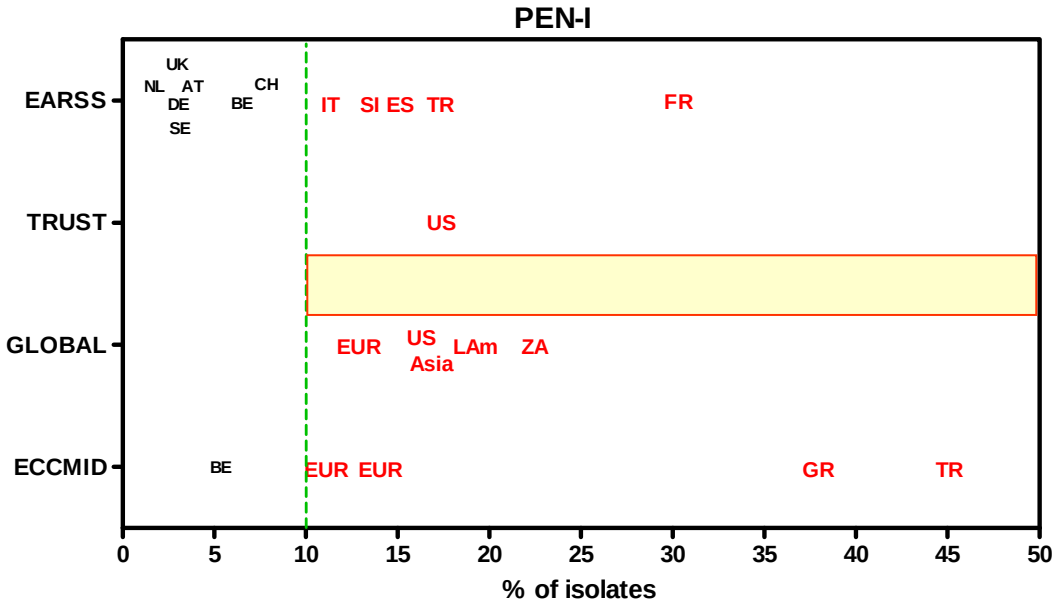
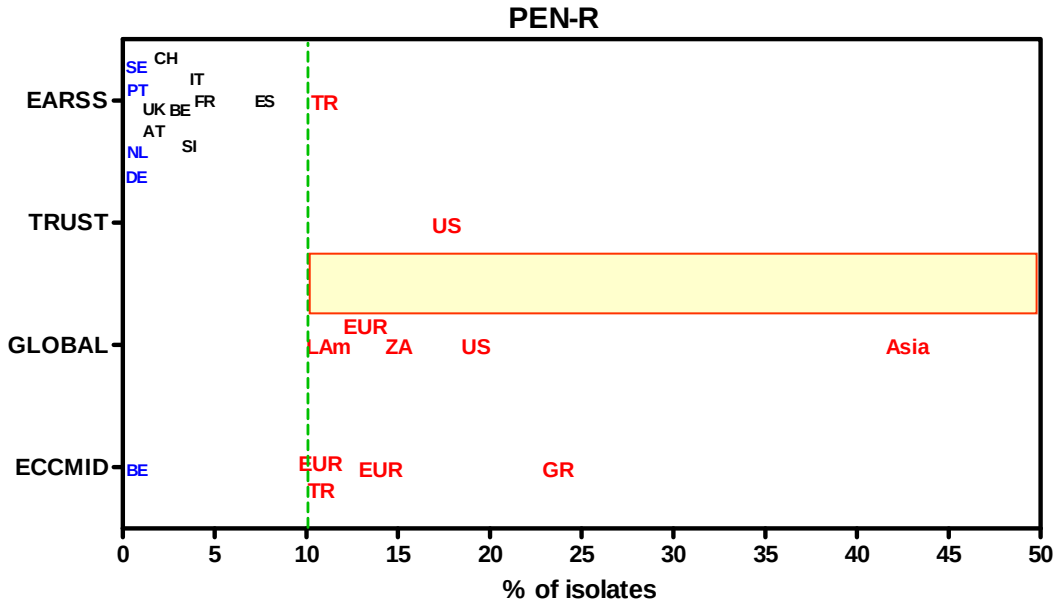
Resistance of *S. pneumoniae* to penicillins *

*Analysis of resistance to penicillins (with CAP as main indication) in surveillance systems or publications (*S. pneumoniae*)

- **EARSS**: European Antimicrobial Surveillance system
- **TRUST**: Tracking Resistance in the United States Today
- **GLOBAL**: Global Landscape On the Bactericidal Activity of Levofloxacin
- **ECCMID**: abstracts of the 18-20th European Congress of Clinical Microbiology and Infectious Diseases

Most studies used CLSI (non-meningitis) breakpoints





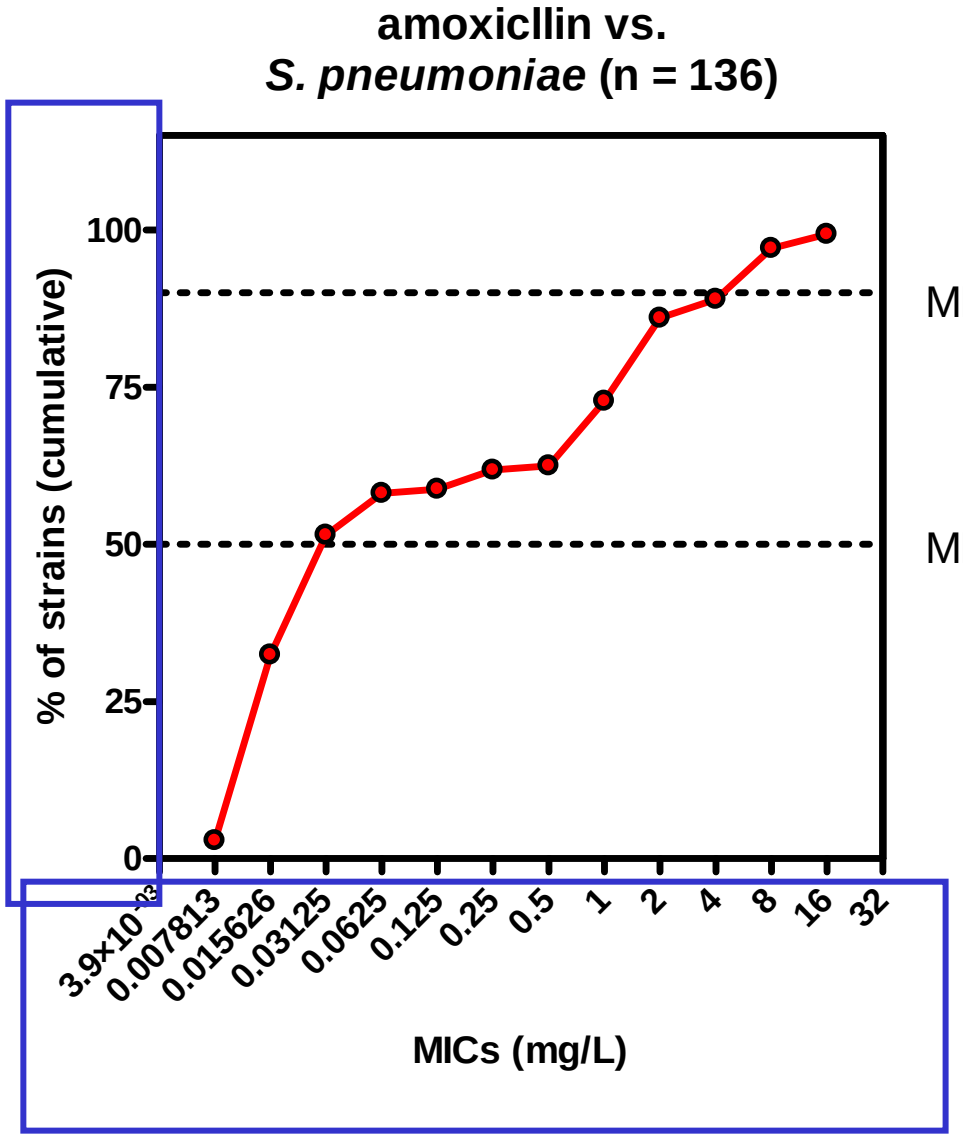
CAP: community acquired pneumonia
CLSI: Clinical and Laboratory Standards Institute (http://clsi.org)

Lismond *et al.*, in preparation

But which breakpoints do we need to use ?

To be honest, I always wondered ...

MIC distribution is a continuous variable…



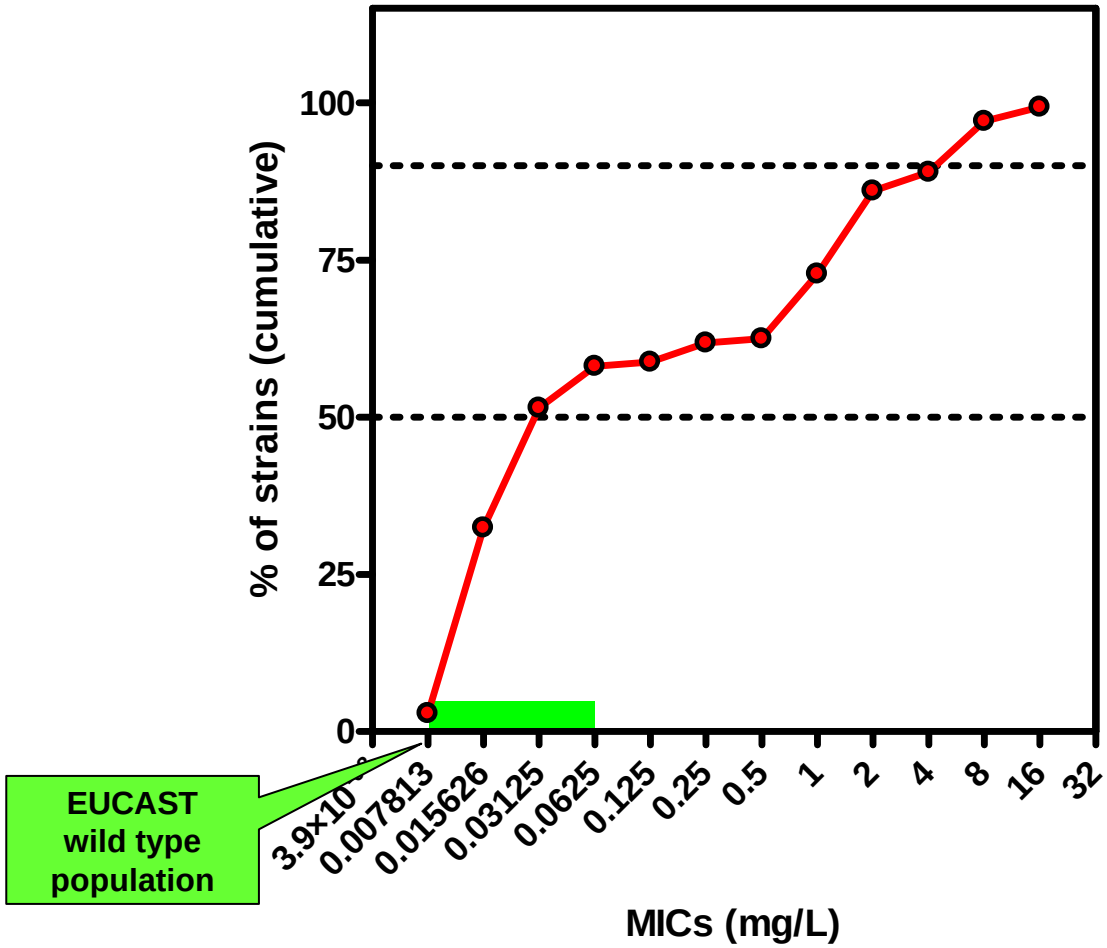
- **Belgian isolates collected between 2009 and 2012 from patients with confirmed cases of CAP**
- **the high MICs of amoxicillin is driven by isolates from patients with past COPD**

Tulkens, unpublished

MIC minimum inhibitory concentration
CAP community-acquired pneumonia
COPD chronic obstructive pulmonary disease

MIC distribution is a continuous variable…

amoxicilin *vs.*
***S. pneumoniae* (n = 136)**

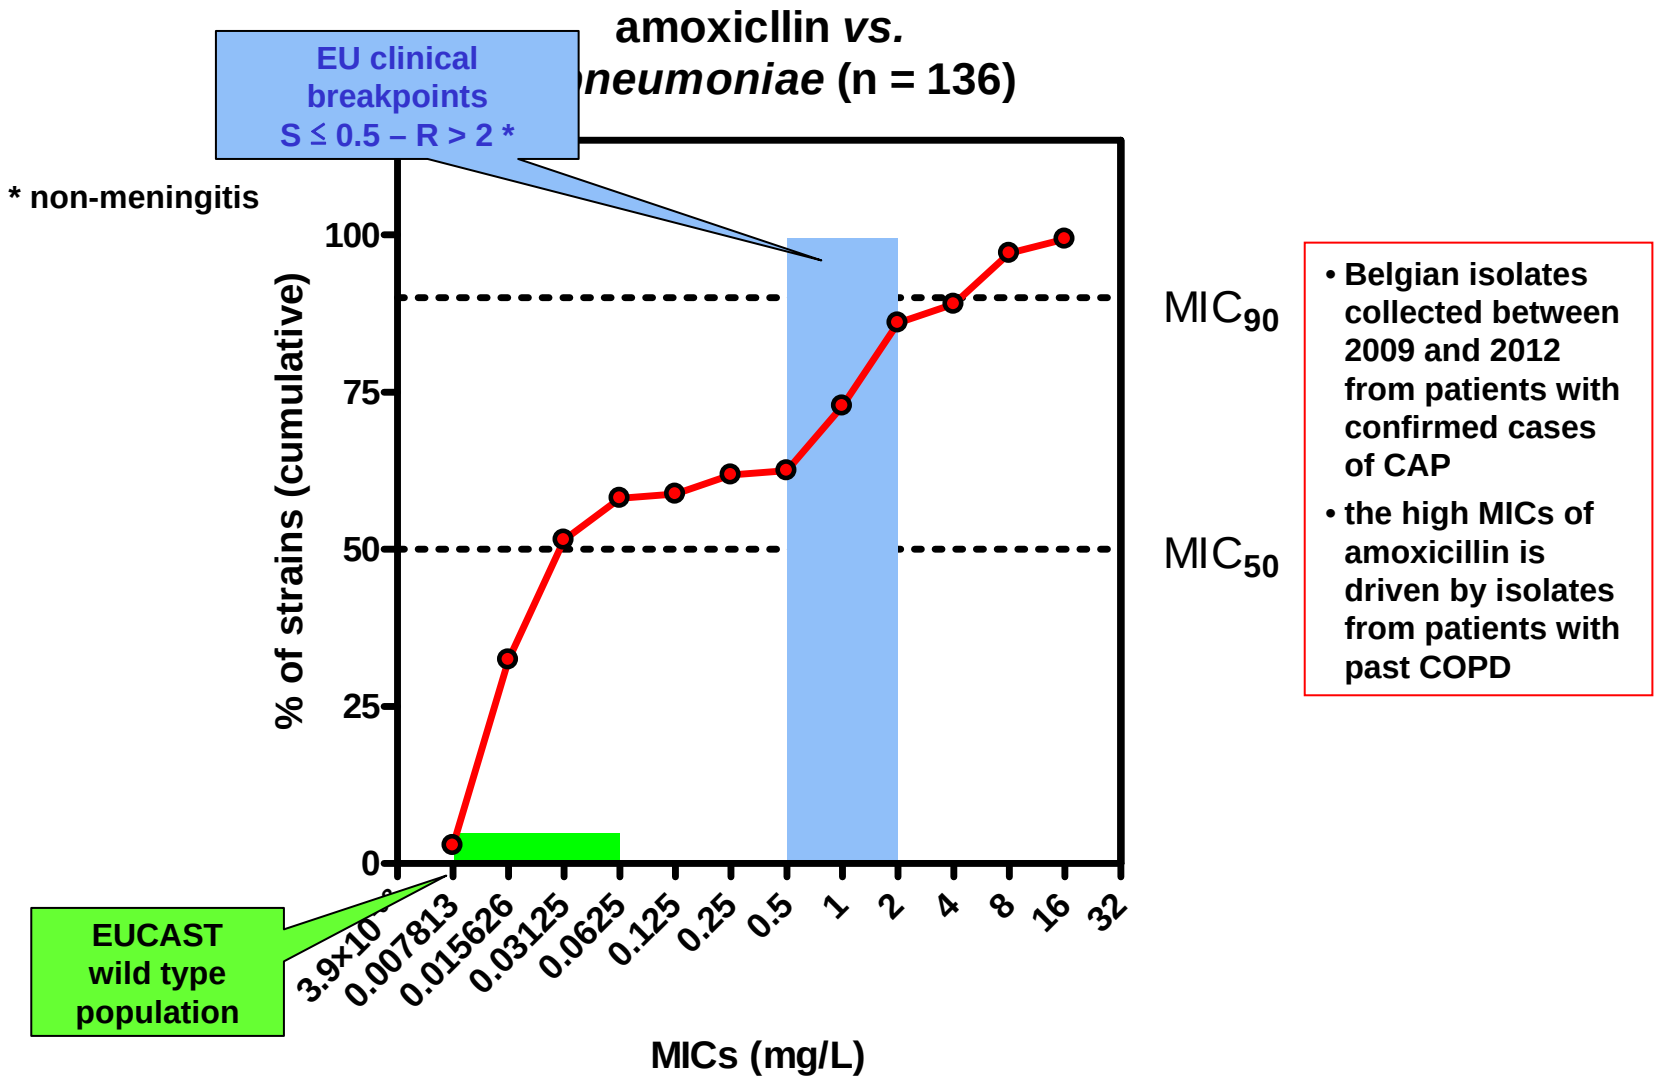


- **Belgian isolates collected between 2009 and 2012 from patients with confirmed cases of CAP**
- **the high MICs of amoxicillin is driven by isolates from patients with past COPD**

EUCAST: European Committee on Antimicrobial Susceptibility Testing (http://www.eucast.org)
MIC: minimum inhibitory concentration
CAP: community-acquired pneumonia
COPD: chronic obstructive pulmonary disease

Tulkens, unpublished

MIC distribution is a continuous variable…

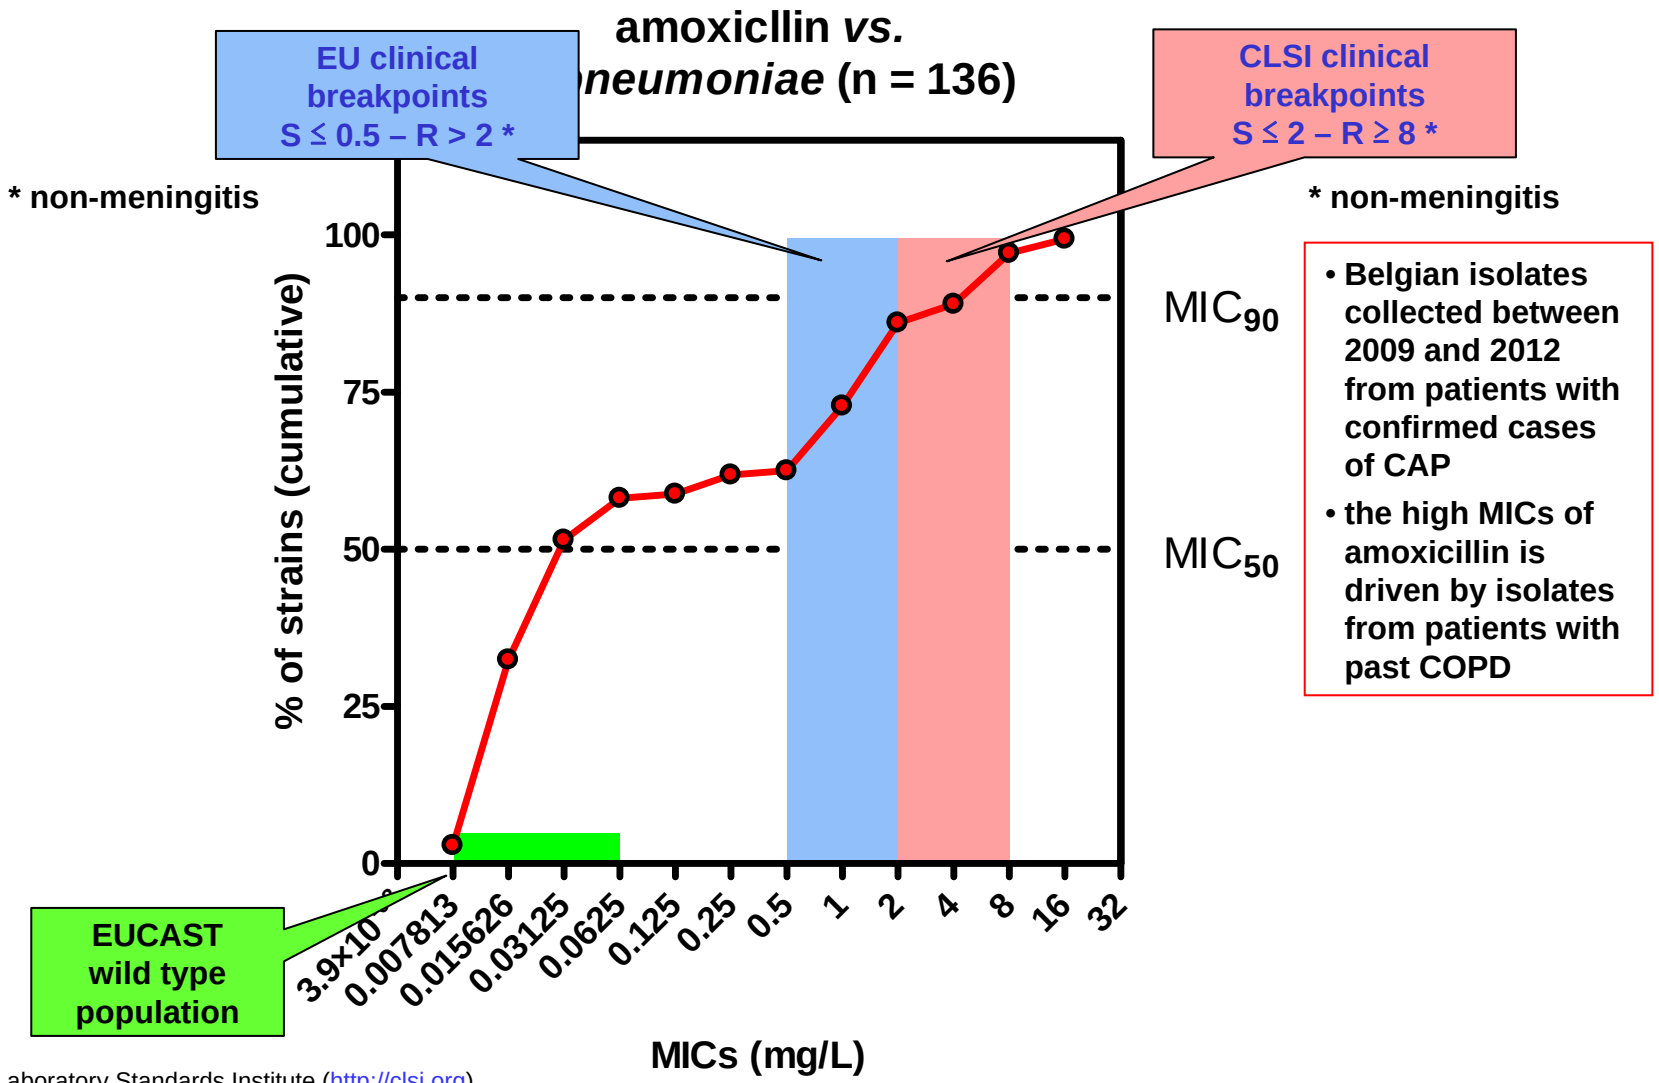


- **Belgian isolates collected between 2009 and 2012 from patients with confirmed cases of CAP**
- **the high MICs of amoxicillin is driven by isolates from patients with past COPD**

EUCAST: European Committee on Antimicrobial Susceptibility Testing (http://www.eucast.org)
MIC: minimum inhibitory concentration
CAP: community-acquired pneumonia
COPD: chronic obstructive pulmonary dosease

Tulkens, unpublished

MIC distribution is a continuous variable…

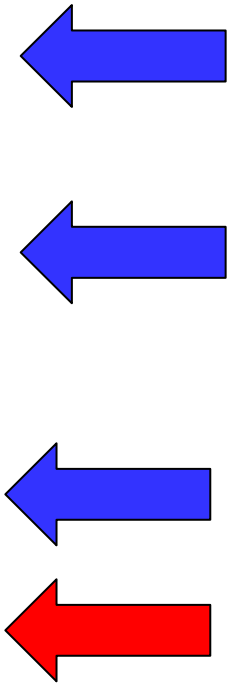


CLSI: Clinical and Laboratory Standards Institute (http://clsi.org)
EUCAST: European Committee on Antimicrobial Susceptibility Testing (http://www.eucast.org)
MIC: minimum inhibitory concentration
CAP: community-acquired pneumonia
COPD: chronic obstructive pulmonary disease

Tulkens, unpublished

Warning about breakpoints (EUCAST *vs.* CLSI) for *S. pneumoniae* (non meningitis)

- With the [new] CLSI breakpoint (MIC ≥ 8 mg/L), very few isolates will be defined as resistant….
- In fact, most experts believe that CAP caused by organisms with a penicillin MIC of 4 mg/L or higher (still an uncommon finding), can lead to an increased risk of death.[1]
- For that reason, Europe has set its "R" breakpoint at > 2 mg/L.[2]
- **Dosage adaptation over the original 250 mg BID is necessary for isolates with MIC between 0.25 and 2 mg/L (➔ 0.5 g TID, 1 g TID, or extended-release forms …)**



CLSI: Clinical and Laboratory Standards Institute
EUCAST: European Committee on Antimicrobial Susceptibility Testing
MIC: minimum inhibitory concentration
CAP: community acquired pneumonia
R: resistance
BID: twice daily; TID: 3 times daily

Resistance of *S. pneumoniae* to macrolides and tetracyclines *

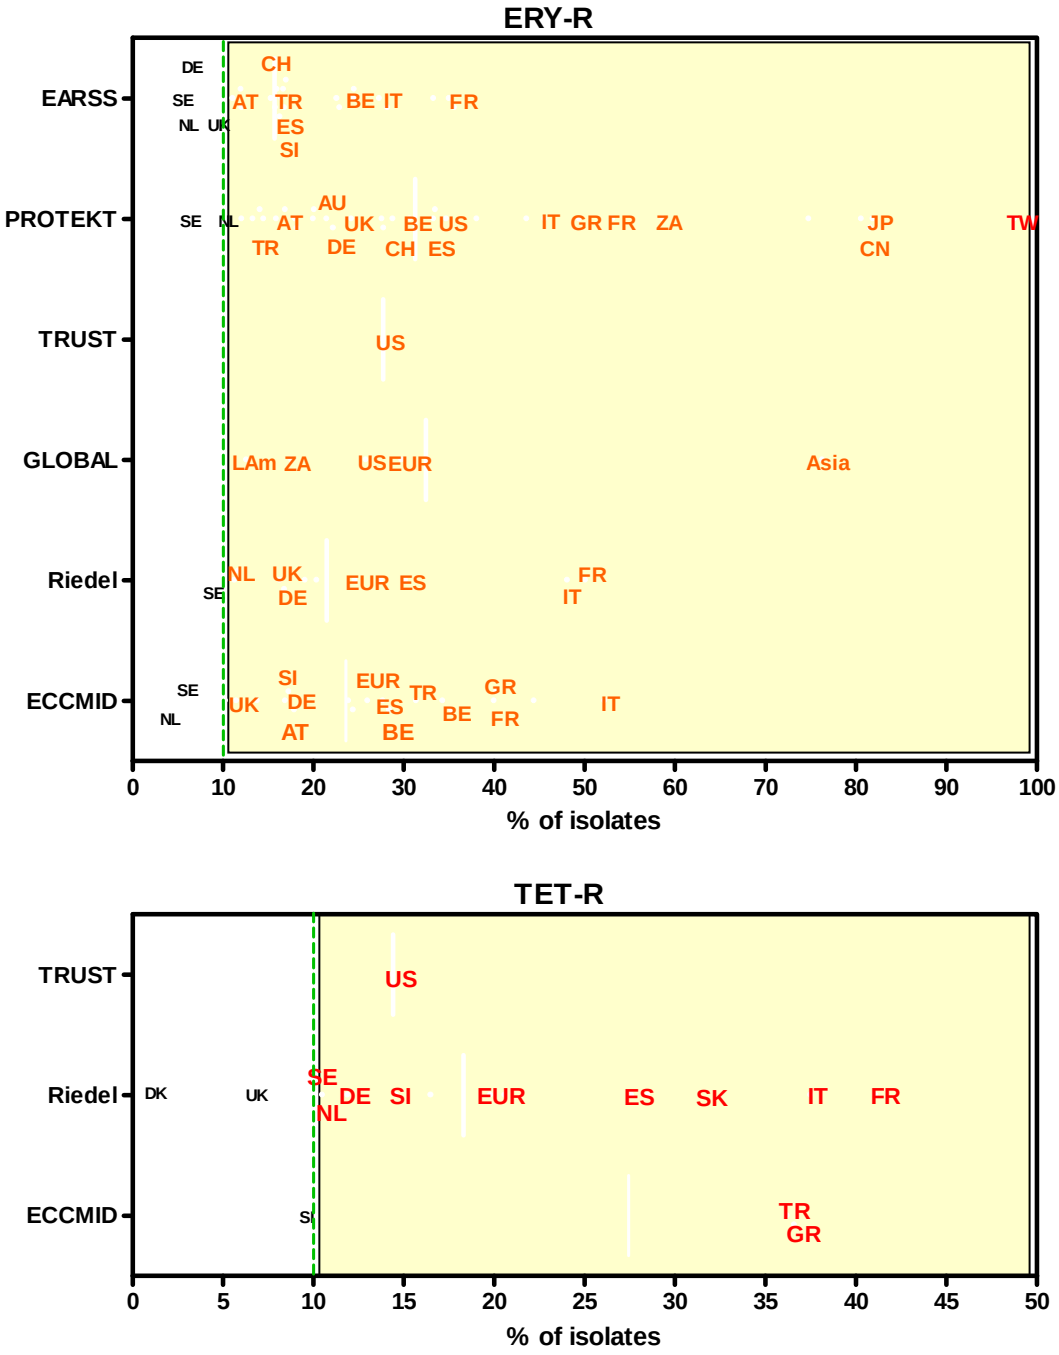
*analysis of resistance to erythromycin and doxycycline (with CAP as main indication) in surveillance systems or publications (*S. pneumoniae*)

- **EARSS**: European Antimicrobial Surveillance system
- **PROTEKT**: Prospective Resistant Organism Tracking and Epidemiology for the Ketolide Telithromycin
- **TRUST**: Tracking Resistance in the United States Today
- **GLOBAL**: Global Landscape On the Bactericidal Activity of Levofloxacin
- **Riedel:** Eur J Clin Microbiol Infect Dis. 2007 Jul;26(7):485-90.
- **ECCMID**: abstracts of the 18th European Congress of Clinical Microbiology and Infectious Diseases

Most studies used CLSI breakpoints
- erythromycin: S ≤0.25 – R ≥1
- Doxycycline: S ≤0.25 – R ≥1

Lismond *et al.*, in preparation

CAP: community-acquired pneumonia



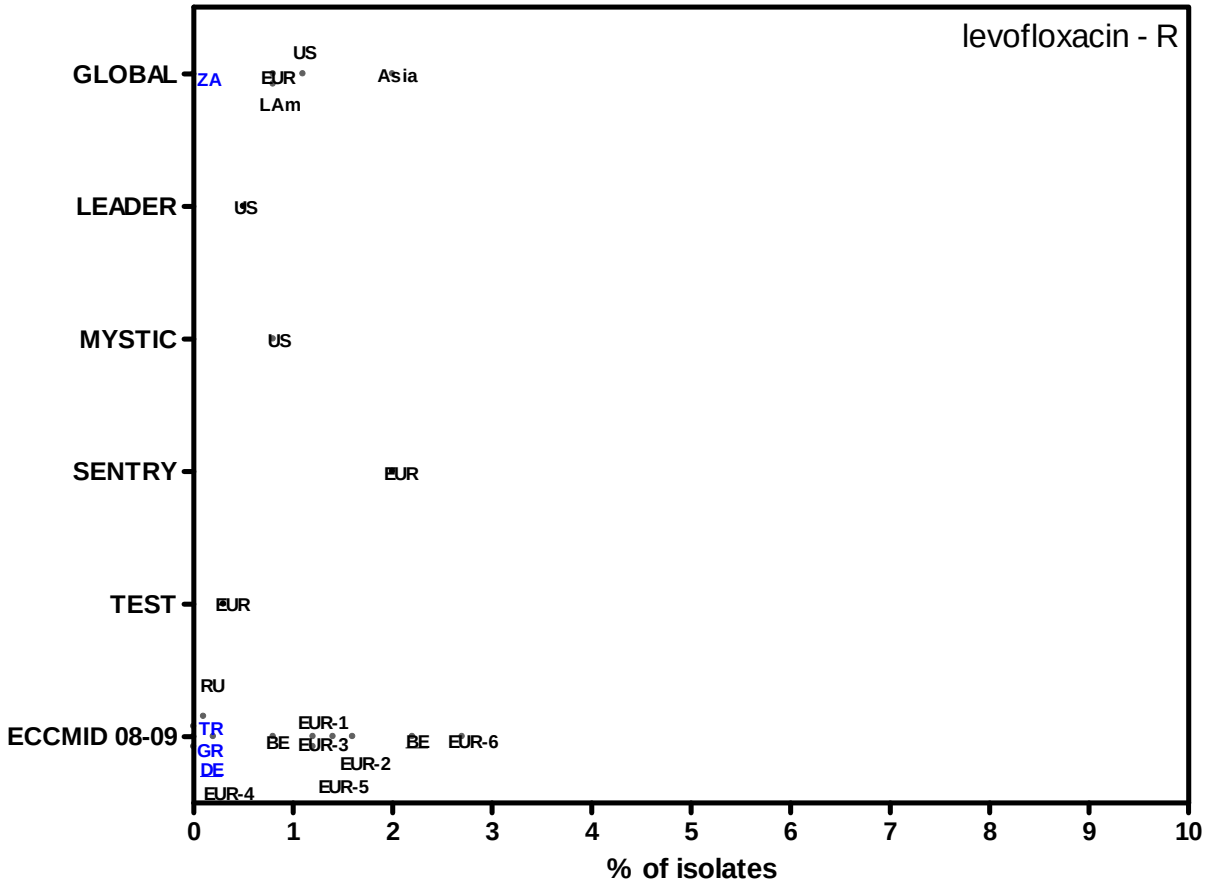
Resistance of *S. pneumoniae* to fluroquinolones

*analysis of resistance of erythromycin and doxycycline (with CAP as main indication) in surveillance systems or publications (*S. pneumoniae*)

- **GLOBAL:** Global Landscape On the Bactericidal Activity of Levofloxacin
- **LEADER:** Linezolid Surveillance Program
- **MYSTIC:** Meropenem Yearly Susceptibility Test Information Collection
- **SENTRY:** Antimicrobial Surveillance Program (2005–2006)
- **TEST:** Tigecyline Evaluation Surveillance Trial
- **ECCMID 08-09** : abstracts of the 18th and 19th European Congresses of Clinical Microbiology and Infectious Diseases

Most studies used CLSI breakpoints

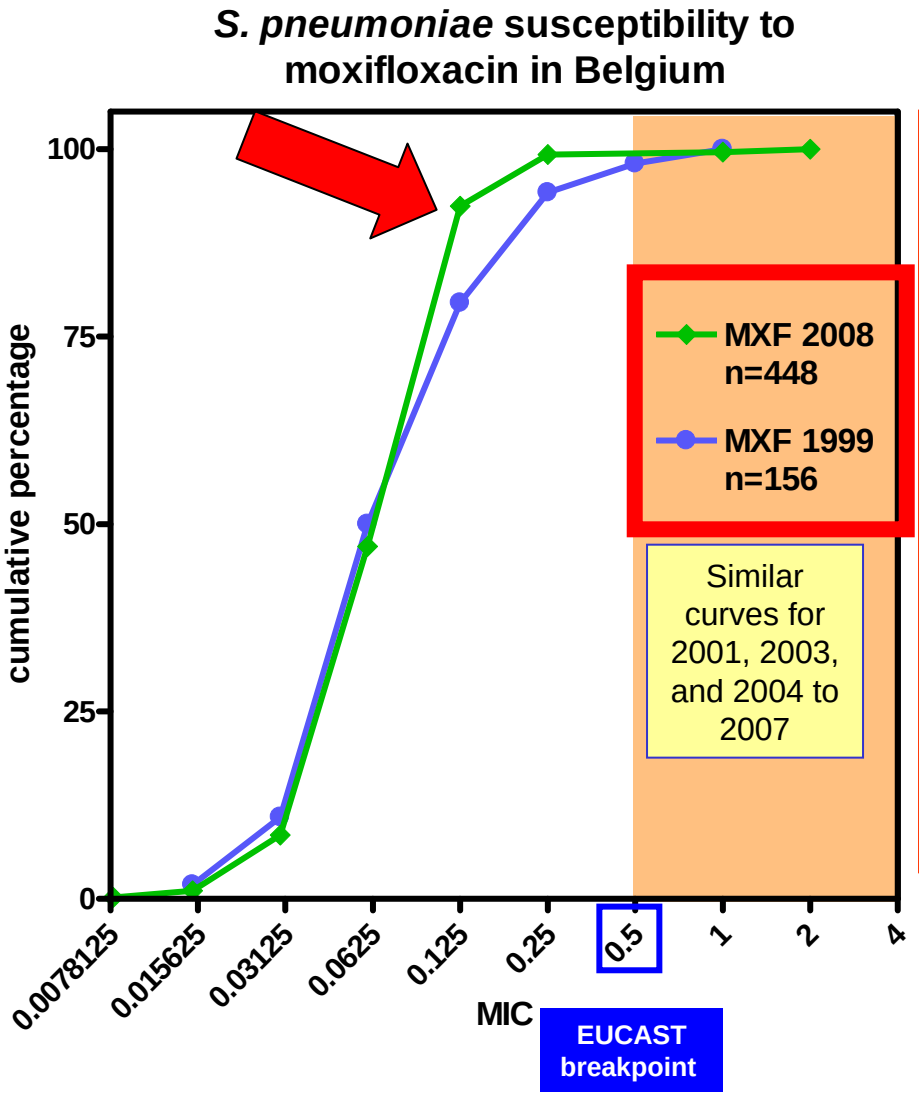
- levofloxacin: S ≤2 – R ≥8
- doxycycline: S ≤1 – R ≥4



Lismond *et al.*, in preparation

CAP: community-acquired pneumonia

Moxifloxacin MIC's against *S. pneumoniae* in Belgium from 1999 to 2008



- Extract from the data of a national collection based on annual surveys made by the Belgian Scientific Institute for Public Health for *S. pneumoniae* from community isolates [https://www.wiv-isp.be/Programs/communicable-infectious-diseases/Pages/EN-BacterialDiseases.aspx?pflg=1033] and presented at the 19th ECCMID. May, 16-19 2009, Helsinki (Vanhoof *et al* abstract no. O467 [http://www.blackwellpublishing.com/eccmid19/abstract.asp?id=74082; last visited: 2 may 2014])
- See also
  - Vanhoof *et al* Acta Clin Belg. 2006;61:49-57
  - Vanhoof *et al* Pathol Biol (Paris) 2010;58:147-151)
- Confirmed in an independent study for the period 2004-2009 (Simoens *et al* Antimicrob Agents Chemother 2011;55:3051-3)
- Similar distribution for blood-stream isolates from patients with clinically confirmed diagnostic of CAP in 2007-2010 (Lismond *et al* Int J Antimicrob Agents. 2012;39(3):208-216)

MXF: moxifloxacin
CAP: community-acquired pneumoni
MIC: minimum inhibitory concentration

Resistance of *S. pneumoniae* to fluroquinolones

- The situation may be different in other countries (Asia)
  - 4% resistance to levofloxacin for PNRSP in China [1]
  - 8.6 % (6/70) in adults in China [2]
  - 4.7 % in Asian Countries (all cases from Korea, Hong-Kong, Taiwan) in association with previous treatment with fluoroquinolones, cerebrovascular disease, and healthcare-associated infection [3]

M. pneumoniae

L. pneumophila

C. pneumonaie

FIG. 6. Data from an active surveillance study performed in Ohio in 1991, showing age-specific rates of community-acquired pneumonia due to the major bacterial pathogens. *M. pneumoniae* infections were diagnosed by seroconversion, using CF tests. These data demonstrate that *M. pneumoniae* causes a relatively large proportion of pneumonias of sufficient severity to warrant hospitalization among persons younger than 50 years but that it is also an important cause of pneumonia in older age groups. Sp, *S. pneumoniae*; Mp, *M. pneumoniae*; Lp, *L. pneumophila*; Cp, *C. pneumoniae*. Reprinted from reference 283 with permission of the publisher.

Department of Pediatrics[a] and Department of Internal Medicine 1,[b] Kawasaki Medical School, Okayama, Japan

We conducted nationwide surveillance to investigate regional differences in macrolide-resistant (MR) *Mycoplasma pneumoniae* strains in Japan. The prevalence of MR *M. pneumoniae* in pediatric patients gradually increased between 2008 and 2012. Although regional differences were observed, high levels of MR genes were detected in all seven surveillance areas throughout Japan and ranged in prevalence from 50% to 93%. These regional differences were closely related to the previous administration of macrolides.

Mycoplasma pneumoniae

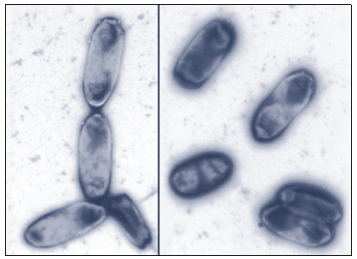
A previously healthy 23-year-old Chinese who had been studying in Spain for 1 year but returned from a 1-month trip to China and Korea 13 days before the onset of symptoms.

Haemophilus: is it important ?



http://www.pathologyoutlines.com/topic/lymphnodeshinfluenzae.html

- *Haemophilus* is often considered as a colonizer of the upper respiratory tract with risks only for patients with COPD
- However, in coinfection with a preceding viral infection, *Haemophilus* may easily colonize the lung, leading to lethal secondary bacterial pneumonia.
  - We may now understand the corresponding genetic background (e.g. overexpression of an anti-oxidant protein) [1]
- β-lactamase-negative ampicillin-resistant (BLNAR) *Haemophilus* may be on the rise in some regions in Europe (but not all) [2]
  - antibiotic discs may fail to fully separate between BLNAS and BLNAR populations [3]
  - the majority of invasive *H. influenzae* (including BLNAR) remain susceptible to third-generation cephalosporins and fluroquinolones in Europe [4]
- Resistance of Haemphilus to fluroquinolones may be on the rise in Asia [5]

COPD chronic obstructive pulmonary disease
BLNAR β-lactamase-negative ampicillin-resistant
BLNAS β-lactamase-negative ampicillin-sensitive

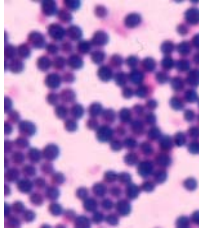
Staphylococcus aureus



http://www.microbeworld.org/index.php?option=com_jlibrary&view=article&id=7611

- Nosocomial pneumonia involving hospital-acquired (HA) *S. aureus* is becoming increasingly frequent [1,2]
- In parallel, pneumonia caused by community-acquired (CA) MRSA while remaining rare in Europe[2] are becoming common in several other parts of the world including Asia [3]
- As many strains (even MSSA) produce toxins, they cause major tissue damage, and, hence a high mortality [3,4,5]

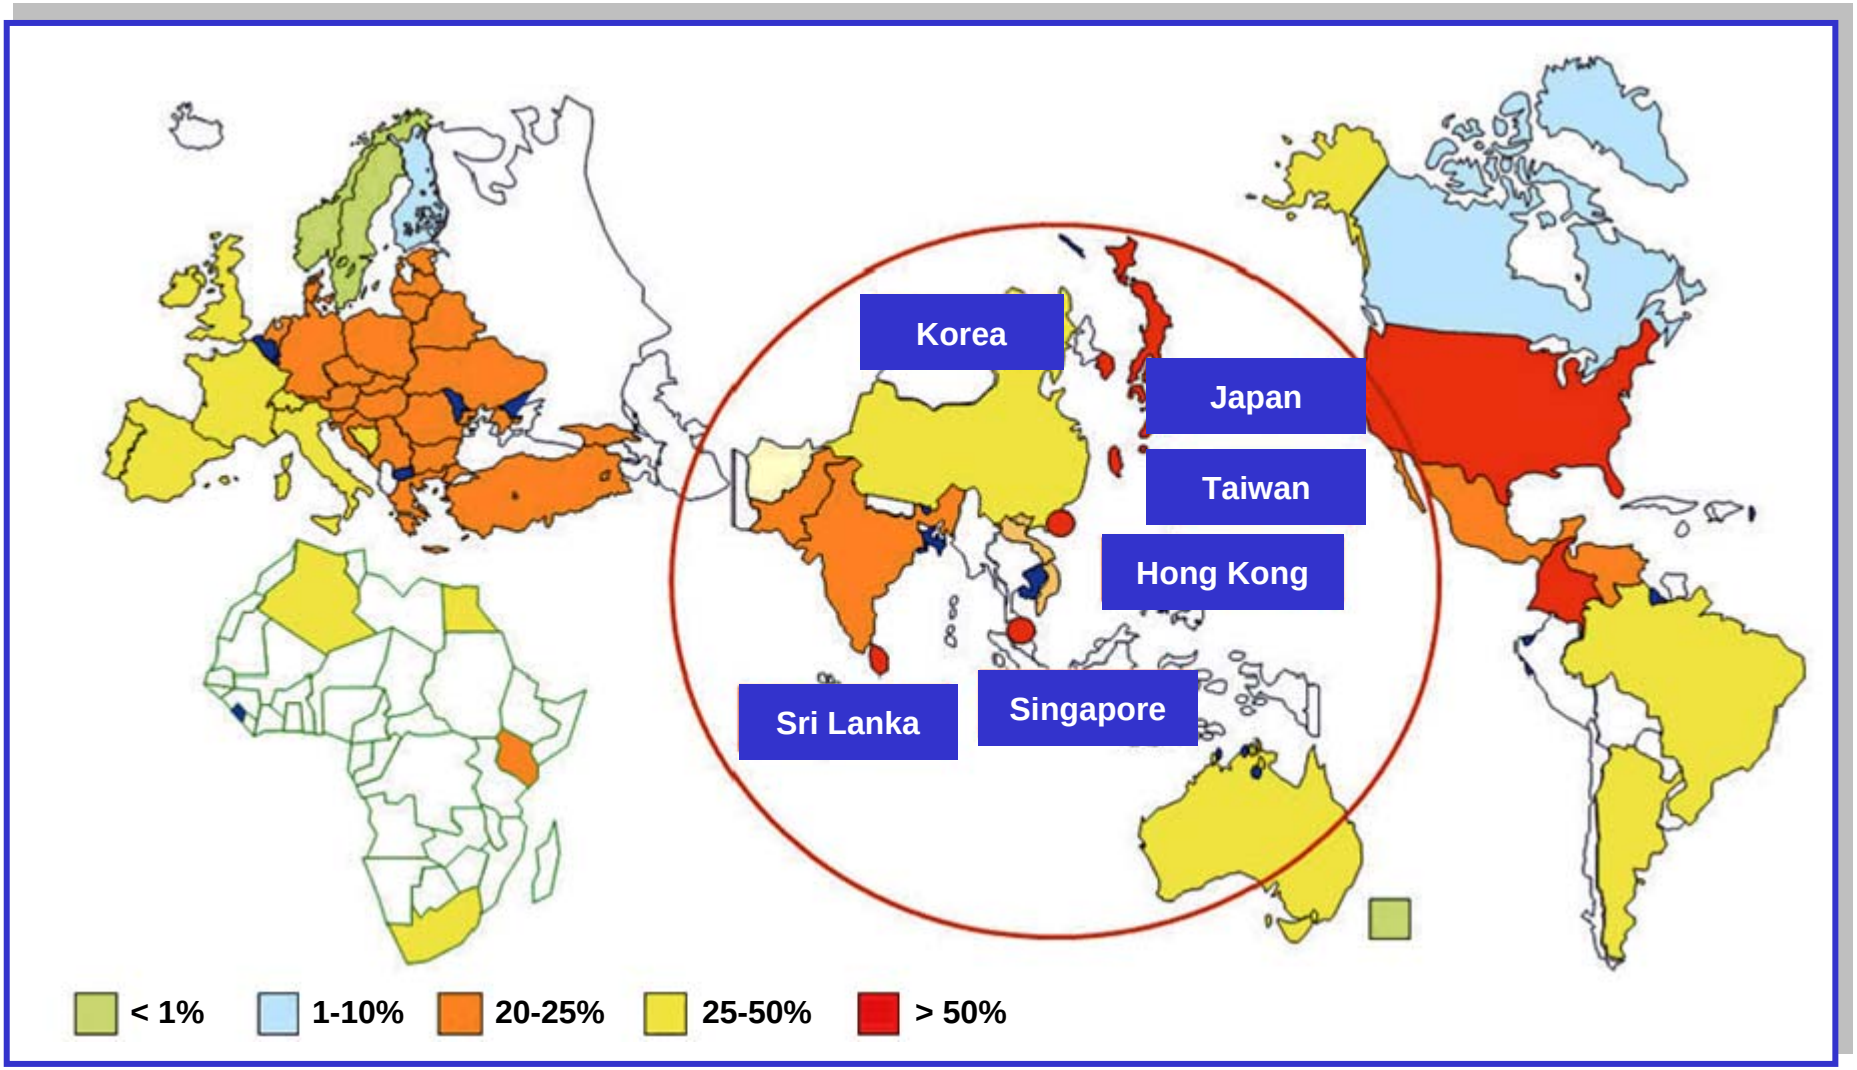
MRSA in Asia

Prevalence of methicillin resistance among *S. aureus* isolates.
Some Asian countries have shown the highest prevalence rates of MRSA



MRSA **methicillin restistant *Staphylococcus aureus***

Kang & Song. *Infect Chemother* 2013;45:22-31

S. aureus in Africa

- Very little is known about Africa !
- But data that are coming are challenging…

Huson *et al.* Infection. 2014 Jan 25. [Epub ahead of print]

- high prevalence (20-28 %) of MRSA in urban hopitals (as opposed to rural) in Cameroon
- typical case of *S. aureus* pneumonia (strain resistant to penicillin, cloxacillin, ciprofloxacin, and erythromycin)

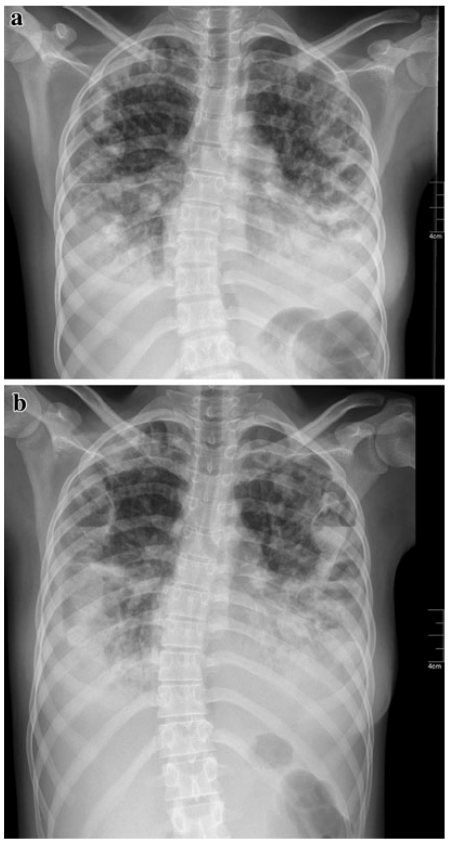


Fig. 1 **a** Chest X-ray at admission shows bilateral infiltrates and cavitary lesions. **b** Chest X-ray 6 days after admission demonstrates deterioration of cavitary lesions with air–fluid levels

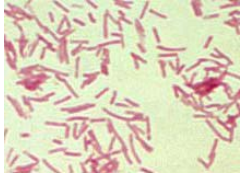
MRSA: methicillin resistant *Staphylococcus aureus*

Anaerobes and lung diseases



B. fragilis
CDC Public Health
Image Library
http://phil.cdc.gov/phil

- Anaerobic bacteria are frequent in aspiration pneumonia and associated complications (aspiration pneumonitis, lung abscess, necrotizing pneumonia and empyema) [1]
- While microbiological documentation is difficult, failure to direct adequate therapy against anaerobes (if present) may lead to clinical failures [2]
- Treatment of anaerobic infection is complicated by the slow growth of these organisms, by the polymicrobial nature of the infections, and by the growing resistance of anaerobic bacteria to antimicrobials (see next slide but only very rare cases for metronidazole [3])

1. Bartlett. *Anaerobe.* 2012;18:235-9

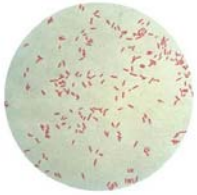
Gram-negatives
(beyond *Haemophilus*, *Legionella*, …)



P.aeruginosa
CDC Public Health
Image Library
http://phil.cdc.gov/phil

- May coexist with Gram-positive organisms…
- But remain the primary causative pathogens of nosocomial pneumonia [1]
- Main organisms include *Escherichia coli*, *Klebsiella pneumoniae*, *Enterobacter species*, *Pseudomonas aeruginosa*, and *Acinetobacter baumannii* [2]
- Inadequate initial therapy is unambiguously linked with increase mortality rate [3]
- Resistance rates vary very much from hospital to hospital and from ward to ward, but risk factors may be identified [1]:
  - hospitalization > 5 days, high resistance rates in the area or specific hospital,
  - immunosuppressive diseases and/or drugs, use of antibiotics in the last 90 days,
  - for health care-associated pneumonia: hospitalization for 2 days within 90 days, residence in a nursing home or extended care facility, home infusion therapy, chronic dialysis within 30 days, home wound care, or a family member with an MDR pathogen

What can we do ?

- **Carbapenems** ... but may be a risk factor [1] for carbapenemase and neither is better [2]
- **Ceftozolane** may help for *P. aeruginosa* (with tazobactam) [3]
- **Avibactam** may restore susceptibility to ceftazidime to a high proportion of Gram-negatives including *P. aeruginosa* [4]
- **Combining** antibiotics (based on checker board [5]) or associating of glycopeptides with colistin for ≥ 5 days [6] could help
- **Extended infusion** (of cefepime) may improve mortality, and decrease mean length of stay and hospital costs [7]
- **Continuous infusion** may be a promising approach [8] ... but may not solve the problem of emergence of resistance... (see next slide)

TABLE 3 C_{min}/MIC ratios required to achieve stasis, 1-, 2-, and 3-log bacterial killing and suppression of emergence of resistance

Bacterial density and status	C_{min}/MIC (mg/liter)			
	Bolus		Extended infusion	
	Hollow fiber	Predicted plasma[a]	Hollow fiber	Predicted plasma[a]
Low				
Bacterial stasis (total bacteria)	1.4	2.0	4.1	5.9
1-log reduction in total CFU/ml	1.8	2.6	5.2	7.4
2-log reduction in total CFU/ml	2.4	3.4	6.7	9.6
3-log reduction in total CFU/ml	3.2	4.6	8.8	12.6
Suppression of resistance	2.4	3.4	7.3	10.4
High				
Bacterial stasis (total bacteria)	3.2	4.6	8.3	11.9

[a] Protein binding is assumed to be 30% (31).

Felton *et al* Antimicrob Agents Chemother 2013;57:5811-5819

Key questions to ask when using guidelines in infectious diseases (with application to pneumonia)

- How sure are you of the diagnosis ?
- **Which are the main pathogens ?**
- **What are their current resistance patterns and how can you avoid emergence of further resistance?**
- How should the therapy be initiated (empiric *vs.* directed) ?
- Which level of adverse effects is acceptable ?
- Which patients do you mainly treat?
- Does cost matter?
- What are your real choices?

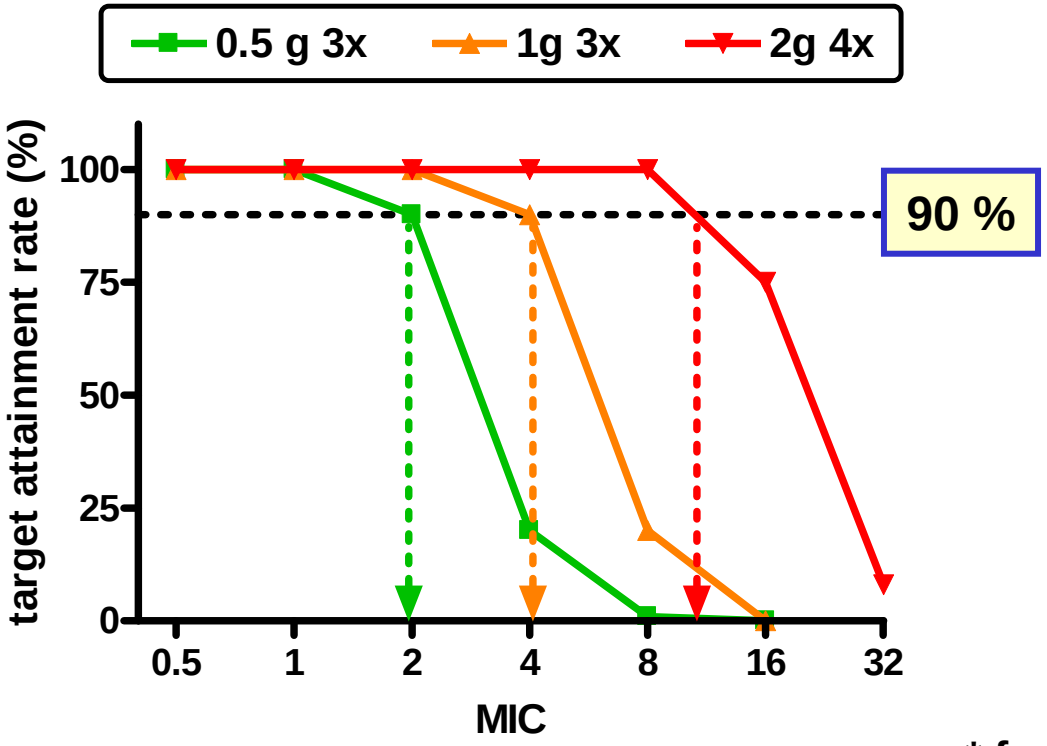
What did I not speak about ... but should have done ... since it may impact your practice

- SCVs
- persisters and biofilms
- rapid diagnostic (including resistance phenotypes and mechanisms) and moving to personalized medicine
- TDM of β-lactams and fluoroquinolones
- new drugs
- pharmacoeconomy and approaches in case of limited resources…
- ….

SCV small colony variants
TDM therapeutic drug monitorig

Back-up

EUCAST calculations of target attainment rate for amoxicillin against *S. pneumoniae*



*** for *f* T >MIC = 40%**

By increasing the dose and multiplying the number of daily administration, you may cover bacteria with MIC up to 8 mg/L… but the total daily dose will be very high and

Are macrolides still useful ?

- not as only agents if resistance rates > 20 % [1]
- but if used in combination with β-lactams to
  - act againts organisms with low susceptibility to β-lactams (*Mycoplasma*, *Chlamydia*, *Legionella*) [2] when these are expected to be present and important (to be discussed)
  - to provide a so-called "antinflammatory activity" (highly discussed [3], but possible development with non-antibiotic derivatives [see next slide]).

1 a value often considered as being a critical threshold in a context of empirical therapy (Limond, *et al. Int J Antimicrob Agents*. 2012;39:208-16)

Global Resistance of *S. pneumoniae*: additional information

- Resistance to β-lactams and macrolides may be higher in children[1]
- Global resistance rates in Asia may be worse than currently reported
  - Erythromycin: > 70% of clinical isolates resistant[2]
  - High prevalence of penicillin resistance if using “old” CLSI or EUCAST breakpoints[3]

Resistance of *S. pneumoniae* to fluoroquinolones

- Several countries noted no or little resistance over time if used appropriately even with relatively large use

Example #1: Canada

Table 1. *In vitro* activities of fluoroquinolones against selected pathogens in the CANWARD study 2007–11 as well as prevalence of MDR isolates involving fluoroquinolone over time

	Year				
Organism/resistance phenotype	2007	2008	2009	2010	2011
S. pneumoniae					
% R[a] levofloxacin (no. of isolates tested)	0.3 (591)	1.5 (514)	0 (129)	0.6 (168)	0 (138)
% MDR[b]	3.2	6.8	3.9	7.1	7.2
% MDR isolates resistant to levofloxacin	5.3	11.4	0	8.3	0

[a]R includes both intermediate and resistant isolates.
[b]MDR includes both intermediate and resistant isolates for the following agents for the following organisms: *E. coli*, *K. pneumoniae* and *E. cloacae* (ciprofloxacin, ceftriaxone, meropenem, piperacillin/tazobactam, trimethoprim/sulfamethoxazole and gentamicin); *P. aeruginosa* (ciprofloxacin, ceftazidime, meropenem, piperacillin/tazobactam and gentamicin); *S. aureus* (ciprofloxacin, clarithromycin, oxacillin and trimethoprim/sulfamethoxazole); and *S. pneumoniae* (levofloxacin, penicillin, clarithromycin and trimethoprim/sulfamethoxazole).

Karlowski, *et al. JAC*. 2013;68(Suppl 1): i39–i46

Resistance of *S. pneumoniae* to fluoroquinolones

- Several countries noted no or little resistance over time if used appropriately even in relatively large use

Example #2: Belgium

Antibiotics used in the ambulatory care in Belgium (reimbursement data [>95% of total use])

Note: *S. pneumoniae* is (probably) the most frequent isolated organism in CAP (~ 20 %), but others may need to be considered (*Mycoplasma pneumoniae* ~ 11 %; *Chlamydia pneumoniae* ~ 8.0 %; *Haemophilus influenzae* ~ 3.3 %), and ~ 50% of cases remain without successful isolation

(Woodhead. Eur Respir J 2002; 36:20s-27s)

S. aureus in Asia: VISA and hVISA

- VRSA and true VISA are rare[1]
- hVISA phenotype is much more frequent
  - 1/3 of MRSA isolates in Korea and was independently associated with a vancomycin MIC ≥2 mg/L and rifampicin resistance[2]
- VISA and hVISA are associated with a longer period of prior glycopeptide use, bone/joint and prosthetic infections, and treatment failure[3]

hVISA heterogeneous vancomycin-intermediate-resistant *S. aureus* :
VISA: vancomycin-intermediate *S. aureus*
VRSA vancomycin-resistant *S. aureus*
MRSA methicillin-resistant *S. aureus*

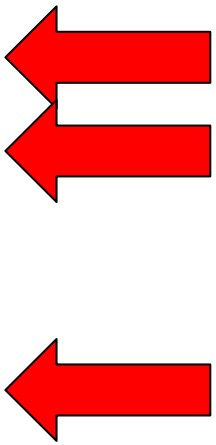
Kaplan-Meier analysis revealed significantly lower ICU survival rates in patients who received inadequate initial antibiotic therapy (*P* = 0.006)

Tumbarello, *et al. Intensive Care Med*. 2013;39:682-92

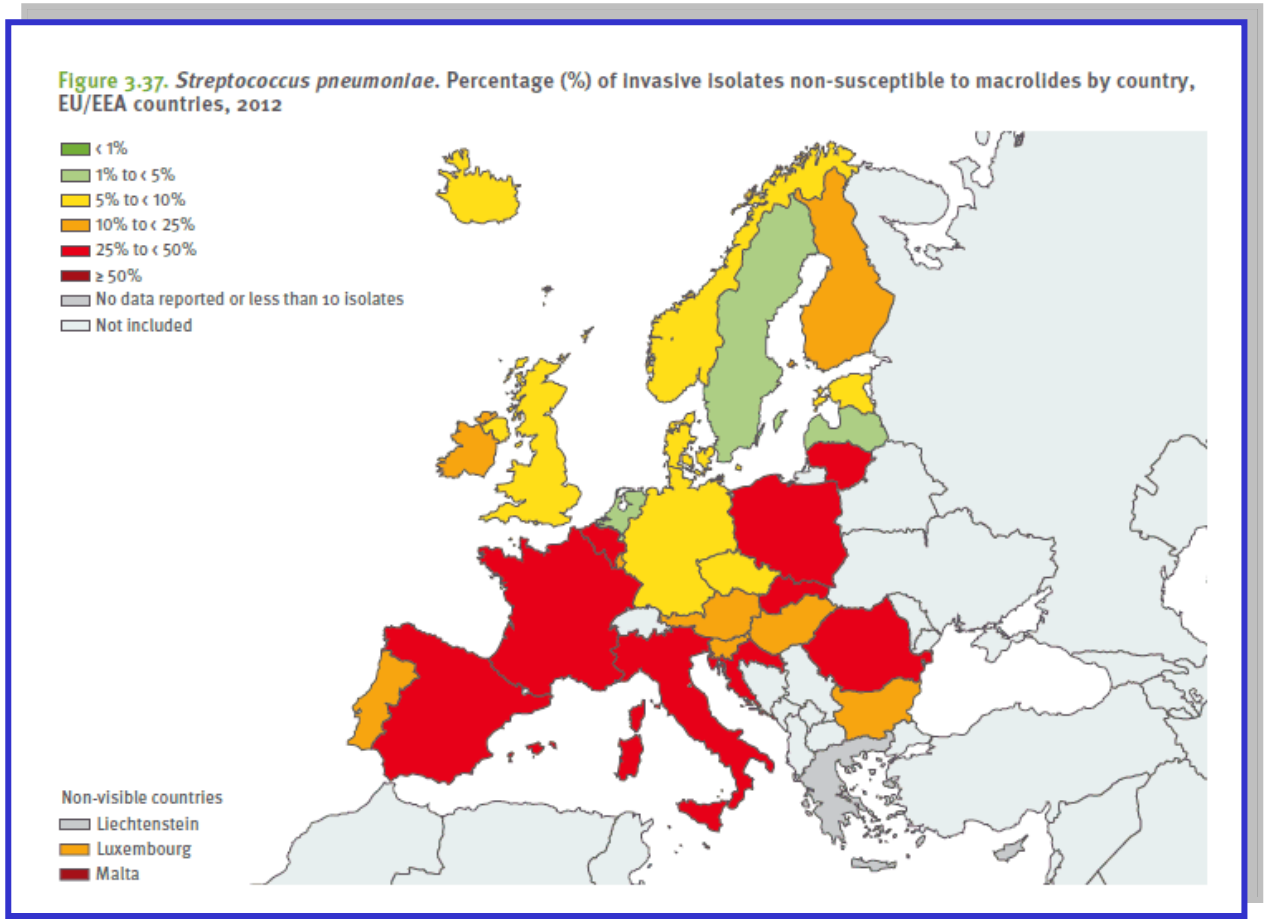
Key questions to ask when setting guidelines in infectious diseases (with application to pneumonia)

- How sure are you of the diagnosis ?
- **Which are the main pathogens ?**
- **What are their current resistance patterns ?**
- How should the therapy be initiated (empiric *vs.* directed) ?
- **Which level of adverse effects is acceptable ?**
- Which patients do you mainly treat?
- Does cost matter?
- What are your real choices?



Some potential approaches

- **Community-acquired pneumonia**
  - **local (country, region...) data on resistance (example: macrolides and *S. pneumoniae*)**



European Centre for Disease Prevention and Control. Antimicrobial resistance surveillance in Europe 2012. Annual Report of the European Antimicrobial Resistance Surveillance Network (EARS-Net). Stockholm: ECDC; 2013. p. 52

Some potential approaches

- **Community-acquired pneumonia**
  - local (country, region...) data on resistance (example: macrolides and *S. pneumoniae*)
  - **stratification for occurrence of resistant pathogens (or with decreased susceptibility [β-lactams])**

Some potential approaches

- **Community-acquired pneumonia**
  - local (country, region...) data on resistance (example: macrolides and *S. pneumoniae*)
  - **stratification for occurrence of resistant pathogens (or with decreased s**

Table 2. Scoring System to Evaluate Presence of MDR Pathogens in Hospitalized Patients With CAP

Variable	Score
No risk factors for MDR pathogen (including comorbidities)	0
≥ 1 of the following: cerebrovascular disease; diabetes; COPD; antimicrobial therapy in preceding 90 days; immunosuppression; home wound care; home infusiontherapy (including antibiotics)	0.5
Residence in a nursing home or extended-care facility	3
Hospitalization for ≥ 2 days in preceding 90 days	4
Chronic renal failure	5

Adapted from Aliberti S, Di Pasquale M, Zanaboni AM, et al. Stratifying risk factors for multidrug-resistant pathogens in hospitalized patients coming from the community with pneumonia. *Clin Infect Dis.* 2012;54(4):470–478.[12] © 2011; Oxford University Press. Used with permission.

Abbreviations: CAP, community-acquired pneumonia; COPD, chronic obstructive pulmonary disease; MDR, multidrug-resistant.

Alberti & Kaye.*Postgrad Med.* 2013;125:31-42

Some potential approaches

- **Community-acquired pneumonia**
  - local (country, region...) data on resistance (example: macrolides and *S. pneumoniae*)
  - stratification for occurrence of resistant pathogens (or with decreased susceptibility [β-lactams])
  - **scoring of severity and potential for Gram-negatives**

Table 4. Recommended community-acquired pneumonia therapy and management from published international guidelines *

	BTS guidelines [24]	ATS/IDSA guidelines [25]	ERS/ESCMID guidelines [26]
Moderate/high severity patients*	CURB65 score 3 or more consider ICU Treat with β-lactam plus macrolide iv	Consider ICU for sepsis or >2 minor severity criteria Increased Comorbidities or prior antimicrobials (within 3 months) treat with respiratory fluoroquinolone or beta lactam plus macrolide iv	Consider ICU for respiratory failure or sepsis or >2 minor severity criteria Stratify by risk for *Pseudomonas aeruginosa* Non-antipseudomonal treat with cephalosporin III + macrolide Or Moxifloxacin or levofloxacin ± non-antipseudomonal cephalosporin III

*These are not necessarily the terms used in the guidelines but give a broad translation of what the guidelines state.

Khan & Woodhead . F1000 Prime Reports 2013;5:43

Some potential approaches

- **Community-acquired pneumonia**
  - local (country, region...) data on resistance (example: macrolides and *S. pneumoniae*)
  - stratification for occurrence of resistant pathogens (or with decreased susceptibility [β-lactams])
  - scoring of severity and potential for Gram-negatives
  - **presence of *S. aureus* (MSSA / MRSA)**

Type of infection	MSSA	MRSA	days
acute / non PVL	• BLRP (150 mg/kg) [a] • amoxyclav (2-6g) • cllindamycin [c]	• vancomycin (30mg/kg) [b] • teicoplanin (400-600 mg/day • clindamycin [c] • pristinamycin	4-7
necrosis / PVL +	• BLRP (150-200 mg/kg) [a] **+** clindamycin [c]	• vancomycin (30-40 mg/kg [b] or continuous infusion) **+** clindamycin [c] • linezolid (1.2g q12h) * • ceftaroline (1.2g) + clindamycin [c] *	≥ 14

[a] β-lactamase-resistant penicillin (in 3 or 4 administrations/day (q8h or Q6h)) ; [b] in 2 administrations per day (q12h) ; [c] 1.8 to 2.4 g/day in 3-4 administration per day (q8h or q6h); * non-validated (off-label)

Translated from Valour *et al* Rev Pneumol Clin. 2013;69:368-82

Some potential approaches

- **Hospital acquired pneumonia (including VAP)**
  - preventive measures (VAP)

Table 1. Effects of the main preventive measures for ventilator-associated pneumonia prevention in randomized controlled studies or last meta-analyses

Intervention	Year, design	Patients (*n*)	RRR of VAP (%)
Reducing the time at risk			
NPPV	2005, meta-analysis (12 studies)	3030	↓ 25%
Preventing endotracheal tube colonization and minimizing contaminated microaspirations			
Silver-coated ET	2008, RCT (54 ICUs)	1509	↓ 36%
Saline instillation before tracheal suctioning	2009, RCT (one ICU)	262	↓ 54%
ET with SSD	2010, meta-analysis (13 RCTs)	2442	↓ 48% (four RCTs)
Endotracheal tube with ultrathin membrane and SSD	2007, RCT (one ICU)	280	↓ 64%
Endotracheal tube with an ultrathin and tapered-shape cuff membrane	2008, RCT (one ICU)	134	↓ 45%
Continuous control of tracheal cuff pressure	2011, RCT (one ICU)	122	↓ 63%
Head-of-bed elevation	1999, RCT (two ICUs)	86	↓ 78%
Kinetic beds	2006, meta-analysis (15 RCTs)	1169	↓ 53% (10 RCTs)
Positive end-expiratory pressure	2008, RCT (three ICUs)	131	↓ 63%
Modulation of colonization			
Oral care with chlorhexidine	2010, meta-analysis (12 RCTs)	2341	↓ 24%
Probiotics	2010, RCT (one ICU)	146	↓ 47%

Data from [17]. ET, endotracheal tube; NPPV, noninvasive positive pressure ventilation; RCT, randomized controlled trial; RRR, relative risk reduction; SBT spontaneous breathing trial; SSD, subglottic secretion drainage; VAP, ventilator-associated pneumonia.

Barbier *et al*. *Curr Opin Pulm Med.* 2013;19:216-28

Some potential approaches

- **Hospital acquired pneumonia (including VAP)**
  - guidelines: 1. target organisms

Table 3. Current guidelines for the empirical treatment of hospital-acquired pneumonia, including ventilator-associated pneumonia

	Early-onset HAP/VAP (≤Day 4 of hospital stay/MV) without risk factors for MDR pathogen[a]	Late-onset HAP/VAP (≥Day 5 of hospital stay/MV) OR presence of ≥1 risk factor for MDR pathogen[b]
Most common (i.e. targeted) pathogens	MSSA	MRSA
	Streptococcus pneumonia and other streptococci *Haemophilus* sp.	*Pseudomonas aeruginosa*
	Wild-type *Enterobacteriaceae*	Drug-resistant *Enterobacteriacae*
		Acinetobacter baumannii
		Stenotrophomonas maltophilia.

Barbier, *et al. Curr Opin Pulm Med*. 2013;19:216-28

Some potential approaches

- **Hospital acquired pneumonia (including VAP)**
  - guidelines: 2. Societies' recommendations for "early onset" HAP/VAP without risk factors for MDR pathogen (*)

British Society of Antimicrobial Chemotherapy (2008)	American Thoracic Society/Infectious Diseases Society of America (2005)	European RespiratorySociety/ European Society of Clinical Microbiology and Infectious Diseases/European Society of Intensive Care Medicine (2009)
• aminopenicillin/beta-lactamase inhibitor, **or** • cefuroxime	• ceftriaxone, **or** • levofloxacin, moxifloxacin, or ciprofloxacin, **or** • ampicillin/sulbactam, **or** • ertapenem	• ampicillin/sulbactam or amoxicillin/clavulanate, **or** • cefuroxime, cefotaxime or ceftriaxone, **or** • moxifloxacin or levofloxacin (not ciprofloxacin)

*** add vancomycin or linezoid if MRSA is suspected**

Some potential approaches

- **Hospital acquired pneumonia (including VAP)**
  - guidelines: 2. Societies' recommendations for "late onset" HAP/VAP or with ≥1 risk factors for MDR pathogen

British Society of Antimicrobial Chemotherapy (2008)	American Thoracic Society/Infectious Diseases Society of America (2005)	European RespiratorySociety/ European Society of Clinical Microbiology and Infectious Diseases/European Society of Intensive Care Medicine (2009)
early onset with risk MDR • ceftaxime or ceftriaxone **or** • fluoroquinolone **or** • piperacillin/tazobactam	• cefepime or ceftazidime, **or** • imipenem or meropenem, **or** • piperacillin/tazobactam, **or** • ciprofloxacin or levofloxacin **or** • amikacin or gentamicin or tobramycin	• ceftazidime **or** • imipenem or meropenem **or** • piperacillin/tazobactam + ciprofloxacin or levofloxacin
late onset • use local epidemiology • if *P.aeruginosa*: ceftazidime, ciprofloxacin, meropenem or piperacillin/tazobactam		

*** add vancomycin or linezoid if MRSA is suspected**

Guidelines: Local vs General

- The empiric algorithm derived from analysis of local microbiologic data predicted significantly better coverage than one defined by an unmodified guideline-driven approach for early HAP/VAP. Our locally-derived TICU algorithm of ceftriaxone+vancomycin for early pneumonia and piperacillin-tazobactam+vancomycin for late pneumonia optimizes the adequacy of initial therapy. Understanding local patterns of pneumonia ensures the creation and maintenance of empiric algorithms that achieve the best clinical outcomes.

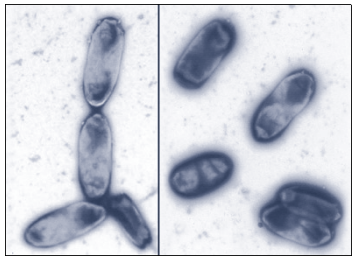
Haemophilus*:* is it important ?



http://www.pathologyoutlines.com/topic/lymphnodeshinfluenzae.html

- Haemophilus is often considered as a colonizer of the upper respiratory tract with risks only for patients with COPD
- However, in coinfection with a preceding viral infection, Haemophilus may colonize the lung, leading to lethal secondary bacterial pneumonia.

Genome-wide fitness profiling reveals adaptations required by *Haemophilus* in coinfection with influenza A virus in the murine lung

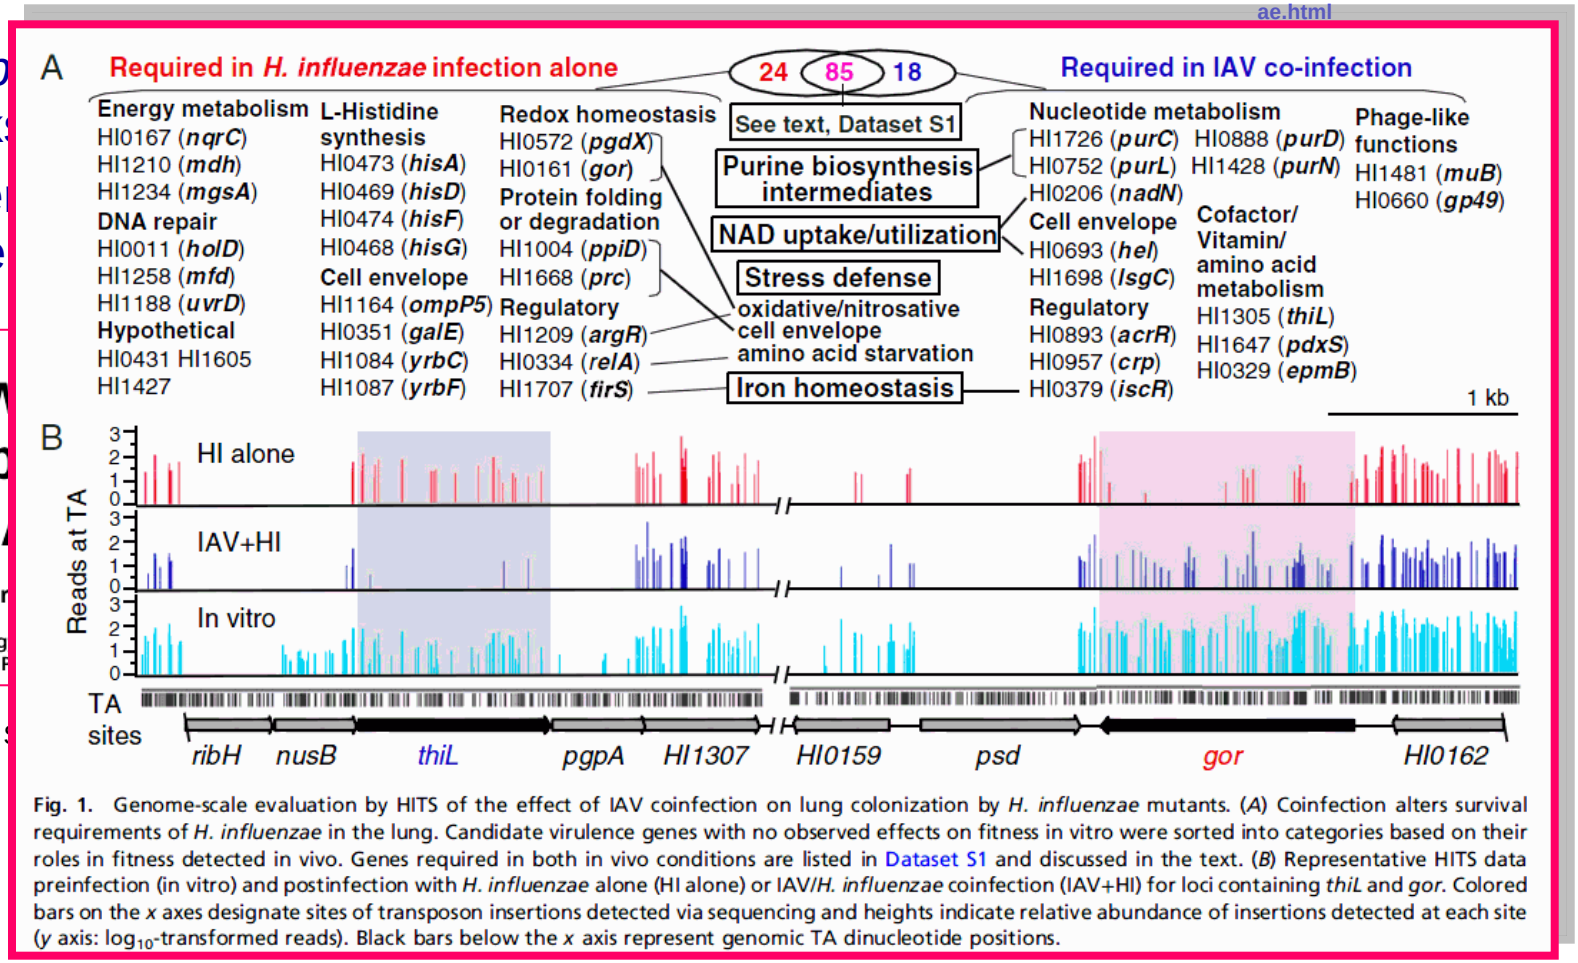

Fig. 1. Genome-scale evaluation by HITS of the effect of IAV coinfection on lung colonization by *H. influenzae* mutants. (*A*) Coinfection alters survival requirements of *H. influenzae* in the lung. Candidate virulence genes with no observed effects on fitness in vitro were sorted into categories based on their roles in fitness detected in vivo. Genes required in both in vivo conditions are listed in Dataset S1 and discussed in the text. (*B*) Representative HITS data preinfection (in vitro) and postinfection with *H. influenzae* alone (HI alone) or IAV/*H. influenzae* coinfection (IAV+HI) for loci containing *thiL* and *gor*. Colored bars on the *x* axes designate sites of transposon insertions detected via sequencing and heights indicate relative abundance of insertions detected at each site (*y* axis: $\log_{10}$-transformed reads). Black bars below the *x* axis represent genomic TA dinucleotide positions.

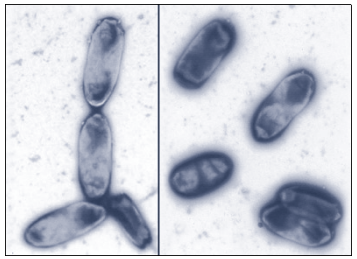
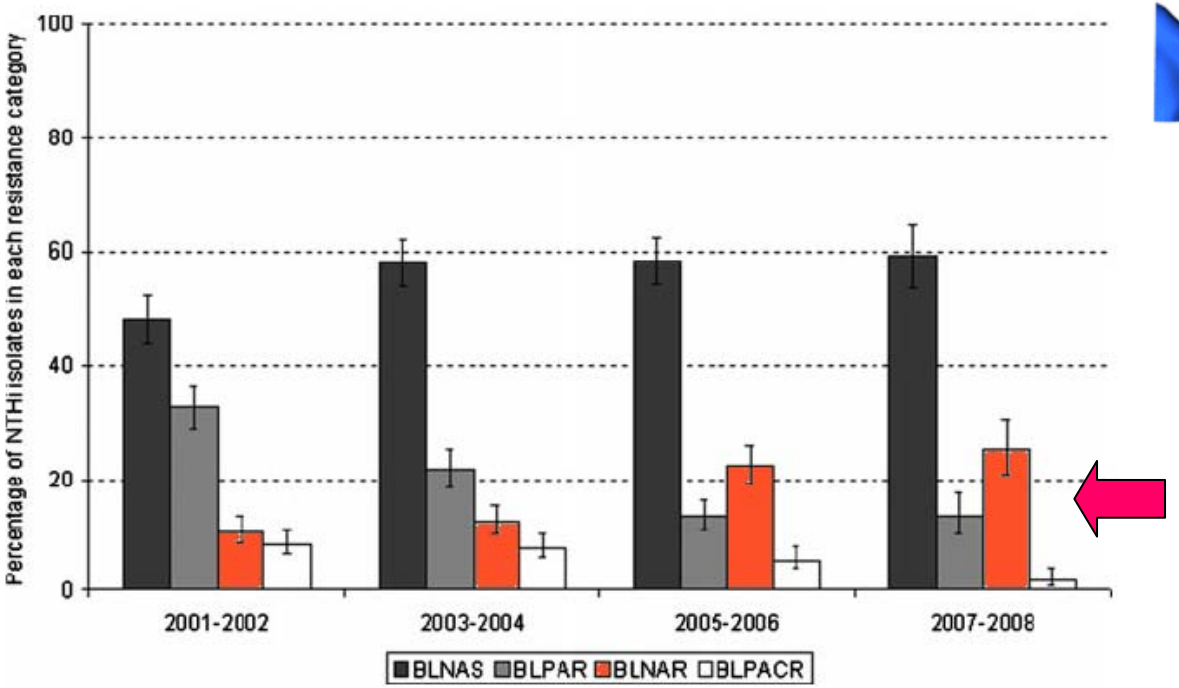
Haemophilus and resistance: recto



http://www.pathologyoutlines.com/topic/lymphnodeshinfluenzae.html

Are -lactamase-negative ampicillin-resistant (BLNAR) isolates important ?

Fig. 1 Evolution of β-lactam resistance of all NTHi strains isolated from children aged 5 years or less in France, from 2001 to 2008. *NTHi*=non-typeable *Haemophilus influenzae*; *BLNAS* = β-lactamase-negative ampicillin-susceptible; *BLPAR* = β-lactamase-positive ampicillin-resistant; *BLNAR* = β-lactamase-negative ampicillin-resistant; *BLPACR* = β-lactamase-positive amoxicillin–clavulanic acid-resistant



Dabernat *et al. Eur J Clin Microbiol Infect Dis*. 2012;31:2745-53

Warning: antibiotic discs may fail to fully separated between BLNAS and BLNAR populations
(Garcia-Cobos, *et al. JAC*. 2013;68: 159–63)

Good news: The majority of invasive *H. influenzae* including BLNAR remain susceptible to third-generation cephalosporins
(Garcia-Cobos, *et al. JAC*. 2014;69:111-6)
See also Puig, *et al PLoS One*. 2013;13-8:e82515 for clinical success with ceftriaxone and fluoroquinolones

But other regions may be spared

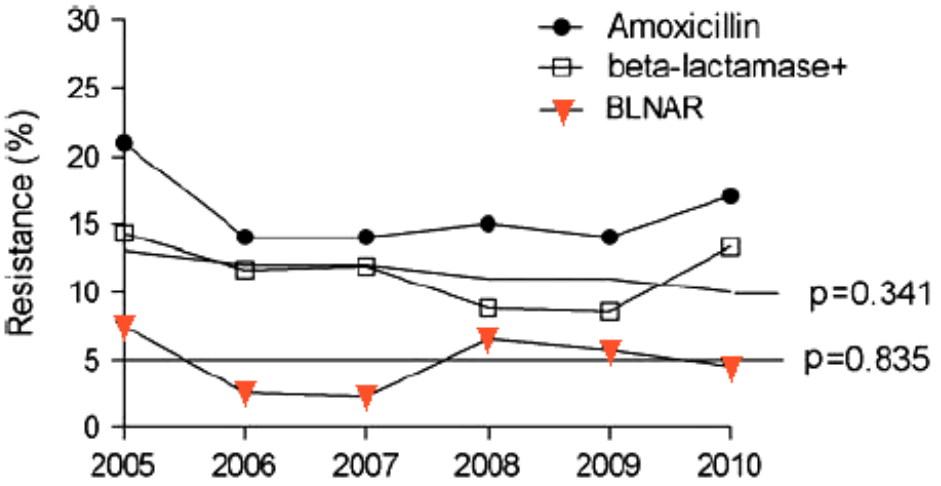

Figure 3. Beta-lactamase-positive and BLNAR isolates over a 6-y period. Division of amoxicillin-resistant strains into BLNAR isolates and beta-lactamase-positive isolates. BLNAR prevalence was approximately 5% over the 6 y and trend analysis showed a stable trend over time. The prevalence of beta-lactamase-positive isolates was approximately 11% over the studied time period. The logistic regression trend line showed a decrease over time, although no statistical difference over time was detected ($p = 0.341$).

Original article

A molecular analysis of quinolone-resistant *Haemophilus influenzae*: Validation of the mutations in Quinolone Resistance-Determining Regions

Hisashi Shoji*, Tetsuro Shirakura, Kunihiko Fukuchi, Takahiro Takuma, Hideaki Hanaki, Kazuo Tanaka, Yoshihito Niki

Showa University, School of Medicine, Department of Medicine, Division of Clinical Infectious Diseases, 1-5-8, Hatanodai, Shinagawa, Tokyo, Japan

Shoji H, *et al. J Infect Chemother*. 2014;20:250-5

We confirmed that these five mutations strongly contribute to quinolone resistance and found that the degree of resistance is related to the number of the mutations. In addition, the three strains of 18 susceptible strains (16.7%) also had a single mutation. These strains may therefore be in the initial stage of quinolone resistance. Currently, the frequency of quinolone-resistant *H. influenzae* is still low. However, as has occurred with β-lactams, an increase in quinolone use may lead to more quinolone-resistant strains.
